

# How Flowroute works

**How the HyperNetwork works**

The patented HyperNetwork uses software to dynamically change the LRN (Local Routing Number) of a telephone number to route calls over a different carrier than the carrier originally assigned. By leveraging multiple carrier relationships, the HyperNetwork ensures redundant communication paths to switch inbound SIP routes from one network to another in the event of a network outage.

*\*Flowroute is only available with Eckoh's CallGuard or Secure Call Recording solutions.*
